

## **Write a simple java program that reads data from one file and writes the data into another file.**

Since the question did not specify which method to use I have used FileReader and FileWriter method for the purpose. We can also perform the action by FileInputStream and FileOutputStream.

```
package swwing;

import java.io.FileReader;

import java.io.FileWriter;

public class swngrndm {

    public static void main(String[] args) throws Exception {

        FileReader fr = new FileReader("E:\\reader.txt");

        FileWriter fw = new FileWriter("E:\\writer.txt");

        int i;

        while ((i=fr.read())!=-1)

            fw.write((char)i);

        fr.close();

        fw.close();

    }

}
```
